## HYDRAULIC PUMPS & MOTORS

DESIGN ENGINEER'S HANDBOOK

---

This catalog contains the information needed to apply and specify a Permco pump or motor for your hydraulic system. These units were developed by Permco to serve the industrial and mobile market. The performance data, presented herein, incorporates the use of the Permco patented Diverter and BiRoDiverter plate which extends bearing life. All units are manufactured from cast iron and incorporate crowned roller bearings and stackable construction.

This catalog is divided into (1) performance and (2) ordering information. Contained within one (1), flowrates, horsepower, torques, etc., can be found. Also approximate weights and overall dimensions. Part two (2) is divided into the individual components which will be combined to suit your particular application. The sections follow in the same sequence as a Permco pump or motor is coded.

This engineering catalog does not include the entire Permco pump and motor line. Other shaft end covers as well as porting arrangements are available. Please contact your local distributor, factory authorized service center or Permco's sales department for further information.

# PERMCO PUMPS AND MOTORS

## GEARS

Precision manufacturing and solid engineering experience are the keys to Permco's long standing reputation for quality and durability. Here are just a few of the techniques and innovations that make Permco pumps a better buy than competitive models:

Gears for Permco pumps are cut in our own plant to extremely close tolerances. Gear width tolerances are held to 0.0003" with backlash held to a minimum of 0.003" to 0.006". To prevent leakage caused by the common "crowning" effect, Permco "shapes" gears rather than hobbing and shaving them. This gives a true involute profile for the full length of each gear tooth, assuring maximum volumetric efficiency. All this extra care means more efficiency in operation, no headaches with hand matched gear sets and longer operating time without rebuilding.

## HOUSINGS

Permco uses a special iron alloy for shaft covers, gear housings, bearing carriers and port end cover castings. The added strength and bearing quality due to this extra care in metallurgy assures more hours of trouble free running for your pump or motor.

## CONVENTIONAL THRUST PLATES

## PERMCO'S PATENTED DIVERTER PLATE OPTION

In pumps and motors ordered with conventional thrust plates you get the added protection of a higher density bronze alloy. The better wearing characteristics of this alloy assure more hours of pump or motor service without the need for costly rebuilding and replacement of thrust plates.

Permco's revolutionary new diverter plate gives you increased working pressures of up to 3,000 p.s.i. It increases "B-10" bearing life up to 3 times, gives running speeds up to 2,400 R.P.M. This is how it works. In other gear type hydraulic pumps, pressure at the outlet side pushes internal moving parts towards the inlet. Gears flex, cutting into the housing. Bearings may overload and break down. Shafts and hubs can wear quickly. Gears wear unevenly. Constant rebuilding and downtime erode profits.

Permco's patented diverter plates reduce pump destroying wear by diverting hydraulic pressure through specially machined channels to key areas on the inlet side of the pump. This fluid pressure acts as a counter force to push gears back towards a centered position. This allows them to function properly while reducing bearing loads.

Bearings function properly with up to three times longer service under rated pressures. Wear to hubs, gears and housings is also significantly reduced. These same diverter plate channels also help to reduce the harmful effect of cavitation.

With high vacuum inlet conditions gears do not "fill" completely; the result is cavitation when the pump is subjected to high vacuum inlet conditions. Permco's diverter plate channels flow to these "partially" filled teeth and displaces cavitation from the diverter plate's surface. Because these plates are not pressure loaded they tend to retain the Teflon coating far better than conventional plates. This aids the pump in the handling of fire resistant fluids. The re-centering force of Permco diverter plates increases proportionally with increased working pressures. On-the-job experiences and in-plant testing indicate that working pressures of 3,000 p.s.i. or speeds up to 2,400 R.P.M. are now possible without unusual wear, depending upon gear width.

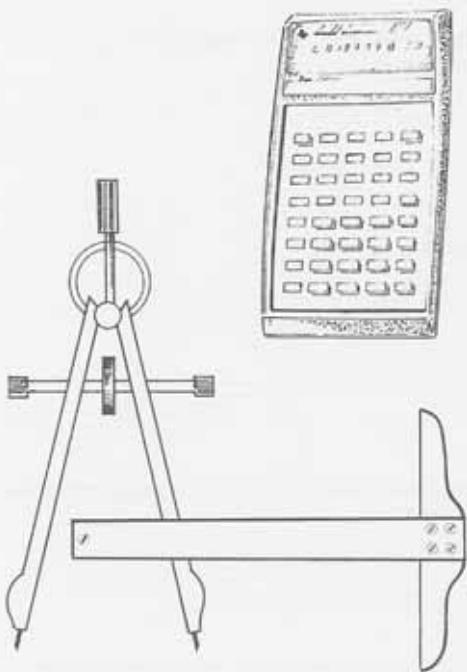

# ANNOUNCING PERMCO'S NEWEST PATENTED FEATURE — BIRODIVERTERS

## FLOW DIVIDERS

## MULTIPLE UNITS

## FIRE-RESISTANT FLUIDS

## PRODUCT SPECIFICATIONS

You can now have the increased efficiency, higher working pressures and increased operating life of the diverter plate in birotational pumps, motors and flow dividers with Permco's newest invention...the patented BiRoDiverter Plate.

Flow dividers are available in 3000, 5000, 7500 (or Doweled) series. Please contact Permco's factory engineering department for details.

Multiple pump and motor units are available in each series and in every size shown on the enclosed performance charts.

Permco pump and motor performance is superior to competitive cast iron, rebuildable pumps when diverter plates are used. This includes phosphate esters, water glycols (hydrolubes) and water-in-oil emulsions. Consult Permco for seal compatibility and performance characteristics when using these fluids.

Figure 1 illustrates the theoretical displacement per inch of gear per rev for each series. Pressures given are for intermittent operation for maximum life.

### PL Factor

In multiple pump applications, the strength of the drive shaft will determine the maximum torque that can be delivered to the unit from the prime mover. This relationship is designated as the "PL" factor and is shown in figure 1. (page 5)

To calculate the actual "PL" factor of any given pump, the following equation should be used.

$$PL = \sum_{N=1}^{\infty} P_N L_N$$

This calculated number must be less than or equal to the stated figures in figure 1 or life rating will be lowered.

Example: A two section 7500 series pump is constructed with 2" and 1" gears, operating at 3000 and 2000 p.s.i. respectively. Will the pump shaft be able to carry the necessary torque?

### Solution: Employing the Equation

$$PL = P_1 L_1 + P_2 L_2 + P_3 L_3 + \dots P_N L_N$$

$$PL = 3000 \times 2 + 2000 \times 1$$

$$PL = 8000$$

Since the calculated PL is less than 12000 (the stated number in figure 1), the shaft will have sufficient strength to carry the torque.

## LIFE (B-10)

Pump life is largely dependent on bearing life. Minimum life of bearings is dependent upon pressure and speed. Please consult factory.

## FLUID RECOMMENDATIONS

Use premium quality hydraulic fluid with a viscosity range 150-300 SUS (32-65 CST) at 100°F (38°C). Normal operating viscosity range is between 80-1000 SUS. (16-220 CST) Maximum start up viscosity should not exceed 4000 SUS. Oil should have maximum anti-wear properties, rust and oxidation inhibitors.

## SIDE LOADS

When a side or overhung load is imposed on the drive shaft of a pump or motor, an outboard bearing must be used (3000, 5000, 7500 series). Double outboard bearings are recommended for 2500 and 3700 series in these applications. Please consult factory.

## FILTRATION (MANDATORY)

For maximum pump life, the system should be protected from contamination at a level not to exceed 250 particles greater than 10 micrometres per millilitre of fluid. A 25 micrometre return line filter with a B 10 rating of at least 2.2 should provide this level of purity. A 149 micrometre suction strainer is also suggested for added pump protection.

## SHAFT ALIGNMENT

Unit shaft alignment must be within 0.007 inches total indicator reading using a standard motor coupling. Follow coupling manufacturer's installation instructions to prevent end thrust on shaft. Turn pump shaft to assure freedom of rotation. Pump and motor must be on a rigid base.

## INLET CONDITIONS

Not to exceed 10 in. Hg at 1200 R.P.M., 7 in. Hg at 1800 R.P.M., or a positive pressure greater than 20 p.s.i.

## MOUNTING RESTRICTIONS

Mounting position is non-restrictive.

## SPEEDS

Typical operating speeds are between 400-2200 R.P.M. Consult factory should these speeds be exceeded.

## TEMPERATURE

Under normal conditions of continuous operation, fluid temperature should not exceed 150°F (65°C). In no instance should the temperature exceed 185°F (85°C).

# REFERENCE CHART FOR GEAR PUMPS AND MOTORS

120	2 1/2	2 1/2	2	2

- NOTE: 1) For other pipe schedules than those listed, consult factory.  
 2) NPT ports are not recommended for pressures exceeding 2000 PSI  
 3) JIC ports are recommended for pressures up to 2500 PSI  
 4) Split flange ports are recommended for all high pressure applications.

## FLUID VELOCITY FORMULAS

$$\text{FPS} = \frac{.408 \times \text{GPM}}{d^2} \quad \text{GPM} = 2.451 d^2 \times \text{FPS}$$

FPS = Feet Per Second

GPM = Gal. Per Minute

d = Inside Dia. of Hose or Pipe

"To more accurately project the actual performance of the average unit the data furnished herein is based upon typical performance after 250 hours of operation."

# PERFORMANCE DATA

Performance data as shown in the following charts was obtained from and based on diverter plate equipped units, and tested with an oil viscosity of 150 SUS (32 CST).

## SHAFT END COVERS

Shaft rotation direction is determined by facing the drive shaft with the shaft in an upper or top position.

Left to right flow..... C/W Clockwise rotation  
Right to left flow..... C/C counter clockwise rotation  
Bi-Rotational..... BR  
Double bearing , Bi-Rotational..... DB

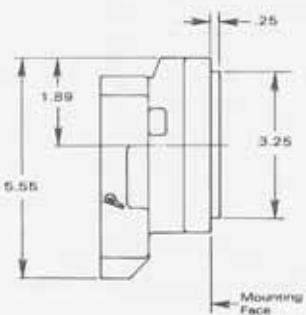

Inversion of the pump will not affect rotation.  
Double outboard bearings are necessary when a side or overhung load is imposed on the drive shaft of a pump or motor. **Please consult factory.**

NOTE: All motor codes contain drain ports; specify if none desired.

**FOR MULTIPLE UNITS ONLY** ALL SERIES

CODE 1

Multiple units are connected with a shaft.  
Every 2 adjacent units in multiple units  
require one connecting shaft.

## BEARING CARRIERS

When using a bearing carrier to provide flow to adjacent gear sections, inlet flow should not exceed 21 GPM (35 GPM for P7500) per side. When the bearing carrier is similarly used for discharge, flow should not exceed 40 GPM (60 GPM for 7500) per side.

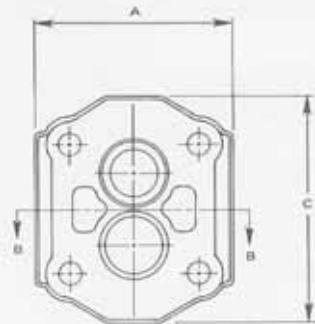

NOTE: For porting specify N.P.T., 4-Bolt Flange, or Straight Thread.
